PREFACE

In the fifth Volume of the Madras Astronomical Observations will be found the result of an examination of the divisions of the Madras Mural Circle in which it appears—that the determinations of North Polar Distance which had up to that time been given are all erroneous to an amount (in extreme cases) of $\pm$ 4 3 and in a paper read at the Meeting of the Royal Astronomical Society on the 13th June 1845 I have shown that the hitherto presumed Longitude of the Madras Observatory was erroneous to the amount of 12 6 seconds of time Now the mischief introduced by these conjoint errors was that all the determinations of North Polar Distance required correction within the above limits and that the comparison of the Right Ascensions of the Sun Moon and Planets with the places assigned in the Nautical Almanac were likewise to some extent erroneous To remedy this evil I had re computed and re arranged all the observations of the fixed stars down to the end of 1842 and their places thus amended are given in Volume VI of these Observations what remained to be done viz the re-computation of the observations of the Sun Moon and Planets and the re computation of the places from the Nautical Almanac has been performed in the present volume in addition to which the places of the Sun Moon and Planets observed since the end of the year 1837 have now been added so as to bring all the observations complete up to the end of 1847

Agreeable to the practice which had been followed in former volumes I have given the indications of the Spirit Level and the result of observations for Collimation and Azimuth for the Transit Instrument and the Index Error for the Mural Circle the latter being determined from the observation of known stars as well as from observations with the Reflecting Collimator these values in addition to the facilities they afford to any one who may have occasion to refer to the original observations are moreover the best testimony I can offer of the consistency and stability of the Instruments and what is equally important as regards observations with the Transit Instrument I have given the daily rate of the Clock for the period following that in which it was last given viz the end of the year 1837

In choosing for myself a plan for observing during the period 1843—1847 I have thought it inexpedient to increase the present Madras Catalogue of 11 015 Stars and have therefore contented myself with re examining from year to year the places of the Stars forming the Nautical Almanac Catalogue which if it has not already done much in the way of investigating the nature of the irregular changes to which those Stars have in some instances been liable will in the end I venture to hope tend to so desireable an issue in addition to this I have re examined—on a more limited scale the places of several of the *proper motion stars* or of Stars in which a suspicion of proper motion existed the Catalogue is not a very large one but having been performed at leisure during one two or three years I venture to hope that its claims for accuracy will still render it acceptable and valuable

Following the Planetary Observations—are given the Observations of the Comets of 1840 and 1845 and after the Catalogues—will be found the Observations of Eclipses Occultations, and Moon Culminating Stars the latter class may without doubt lay claims to ordinary accuracy but the former—are by reason of the insufficient means placed at my disposal—necessarily only mere approximations it gives me pleasure however in closing this volume—to be able to assert that the Equatoreal Instrument *ordered six years ago by the Honorable Court of Directors* is now in fair train of being executed and that the plea of inefficiency here admitted will not again be made

TRANSIT INSTRUMENT AND OBSERVATIONS, ETC

A DRAWING and minute description of the Madras Transit Instrument having been given in Vol I of these Observations it is only necessary here to state that the Instrument was made by Dolland that the focal length of the telescope is 61 inches with a clear aperture of $3\frac{3}{4}$ inches and that a power of 150 has on all occasions been employed the pivots—originally of bell metal—had become so much worn in the year 1833 as to render it necessary to re turn them on which occasion collars of steel were applied by Mr Barrow the Honorable Company's Instrument maker at Calcutta these I am happy to say have done their duty well and now—after thirteen years wear are scarcely if at all altered in appearance or figure—indeed with the exception that the micrometer screw is out of order the Instrument is in as good working condition as when first erected

The rapid growth of vegetation during the period 1836—1840 having completely placed it out of my power to retain a view of the Southern Meridian Mark I have necessarily been reduced to dependance upon the Northern Mark alone added to this the dilapidated state of the micrometer screw—which has in consequence remained unemployed—has since 1840 prevented my continuing the use of the Reflecting Collimator or by other means ascertaining the Collimation and Azimuth errors I have in fact been reduced to the old fashioned plan of inverting the Axis and making use of screws instead of figures to get quit of Collimation or Azimuth errors In a general way the coincidence of the centre wire with the Mark has been examined twice a day at six o clock in the morning and at the same hour in the evening and the examination of the Horizontal Axis with the spirit level has usually been performed twice during the week Inversion of the Axis for the examination of the Collimation has been restricted to twice during the month and has been performed generally on the 1st and 15th In cases however in which the centre wire at evening or morning observation has failed to bisect the Meridian Mark recourse has immediately been had to Inversion The adjustment to the Meridian Mark has on an average not exceeded three times during the year and that for Collimation not nearly so often the amount to be corrected for has usually been very small having only on one occasion exceeded two seconds the level which is a very excellent one has as hitherto been applied twice a week and the correction due to error of level computed and applied to each observation On consulting the results in Vol IV it appears that the radius of the Illuminating Pivot was smaller than that of the other Pivot 0 80 satisfied with the constancy of this result from the observations of 1834—1838 no further attention was bestowed upon this subject until the 6th May 1842 when from three Inversions of the Axis the Illuminating Pivot was found to be smaller than the other Pivot by 1 1 since this time two determinations only have been obtained thus

					Values of P
1846 July 22d	the Illuminating Pivot was smaller than the other				2 13
1847 Sept 17th	do	do	do		2 11

It only remains for me to state that a late careful examination of the Pivots assures me of their having retained their perfectly circular form and that during the entire period 1838—1847 the Illuminating Pivot has continued to occupy the *Western* Pier

The Eye Piece is supplied with five vertical and one horizontal fixed wi es and o e vertical moveable w re the Equatorial Interval between these was determined in 1836 and is given in Vol IV these numbers hold good up to the 25th April 1838 when several of the wires were found broken on a new set being put in the following were found to be the Equatorial Inter als

From 1st wire to the centre	+	54 856
2d — — —	+	27 330
4tl — — —	—	27 470
5th — — —	—	54 400

Rendering necessary the correction + 064 sin N P D to reduce the mean of five wires to the centre

October 13th 1838 found two of the wires broken on putting in a new set the Equatorial Intervals were found to be

From 1 t wire to the centre	+	54 717
2d — — —	+	27 208
4th — — —	—	27 670
5th — — —	—	54 929

Rendering necessary the correction — 135 in N D to reduce the mean of five wires to the centre

November 27th 1842 The wi es appeared to have become bent by reason of the excessive dampness of the air I put in a new set when the Equatorial Intervals were found as follows

From 1st wire to the centre	+	54 982
2d — — —	+	27 459
3d — — —	—	27 410
4th — — —	—	54 946

Rendering necessary the correction + 017 sin N P D to reduce the mean of fi e wires to the centre

On the 28th October 1844 I accidentally broke one of the wires on putting in a new set the Equatorial Intervals were found to be

From 1st w re to the centre	+	55 218
2d — — —	+	27 561
3d — — —	—	27 250
4th — — —	—	54 969

Rendering necessary the correction + 113 i N P D to reduce the mean of five wire to the centre

J nuary 9th 1845 I took out the wire f ame to ex m ne tl wires undei an mpre on that the center w e vas not tigl t th howe er pioved not to be the case on applying fresh arnish to the ends of the wires the following we e found to be the E juatorial Intervals

From 1st wire to the centre	+	54 790
	+	27 765
	—	26 985
	—	54 760

Rendering necessary the correction + 0 162 in N P D to reduce the mean of fi e wi e to the centre

O the 21st Octobe 1845 a further alteration was produced i the Equatorial Inter als by reason of dust having settled upon the wires in removing which the wires were displaced the Equatorial Interval now appeared to be

From 1st wire to the centre	+	54 980
2d — — —	+	27 840
4th — — —	—	27 140
5th — — —	—	54 880

Rendering necessary the correction + 0 160 in N P D to reduce the mean of five wires to the centre

On the 8tl Feb ua y 1846 wl ilst endea ouring to clean some du t off the wi es the ho izontal wire was broken on which I removed the whole and put in a new set of spider web lines The Equato ial Intervals now appeared to be

From 1 t wire to the centre	+	54 510
2d —— — ——	+	27 150
4th —— — ——	—	27 730
5th —— — ——	—	55 380

Rendering necessary the correct on — 0 290 / i N P D to reduce the mean of five wires to the centre

On the 1st January 1847 the wires were displaced in endeavouring to remove some dust which had settled on them the Equatorial Intervals now appea to be

From 1st w e to the centre	+	54 070
2d —— — ——	+	26 530
4th —— — ——	—	27 800
5th —— — ——	—	55 680

Rendering necessary the correction — 0 580 / in N P D to reduce the mean of five wires to the centre

A further and final alteration n the position of the wires took place on the 1st April 1847 in the act of removing the dust which had settled on them the Equatorial Inter als now ppear to be

From 1st wire to the centre	+	54 390
2d —— — ——	+	27 020
4th —— — ——	—	27 950
5th —— — ——	—	55 480

Rendering necessary the correction — 0 400 / in N P D to reduce the mean of five wires to the centre

I am quite at a loss to account for the unusual quantity of black dust which has from time to time during the last two year been so frequently depos ted on the wires it can only be derived from the varnish with which the inside of the instrument is coated losing its hold on the metal

ERROR OF LEVEL OF THE TRANSIT AXIS

In consequence of the nequal ty of the Pivot as just stated the indications of the Spirit level (L—P) require to be corrected by the amount P to give L the true er or of level of the axis The method by which the values of P as given above were a ived at is however liable to some objectio inasmuch as it may be supposed that each Pivot wears a bed fo itself in the Y on which it repo es of a urvature orresponding to its own rad us and that on inverting the axis the large Pivot does not come to the ame bearings as did ts p edecessor the sm ller one on which account the values of P just found will be too la ge with this view of the case I have employed for P 0 80 down to the end of 1840 P = 1 3 from 1840—1844 and 1 80 since that period as follows

Th m th d h all d d to that ally mpl yed v by pplying th Sp t level w th the Illum t g P v t E st as well West

AZIMUTH ERROR

COMMENCING with 17th J nuary 1837 the centre w re was adjusted to a Ma k which had only roughly been e t mate l to repie ent tl me id n the compari on of observations above nd below the Pole showed that the M rk thus assumed wa s tuated 2 58 to the *West* of the Me idian O i the 20th Febru y 1840 the meridian mark havin become somewhat obscured by the ction of wi d a d weather I directed it to be removed and a new mark to be painted on the same p er exactly on the meridi n or 2 6 to tl e *Eastwa d* of that hithe to in use by some mist ke however on the part of the Assistant to whom I had ent sted this alteration the new mark was found to be situated 4 0 to the *Eastward* of the meridian hence f o i 17th January 1837 to the 20th February 1840 the corrections due to an Azimuth error of 2 58 W have been employed and for tl e observations ubsequent to that pe iod in a general way corrections due to an A imuth of 4 E have been allowed save n a fe v cases where from obser at o i of δ o λ *U sæ M nons* a sl ght modif cation of this amount has been considered justif ble the l mits l owe e have been between 2 5 E and 5 2 East

CLOCK ERRORS AND RATES

In the computation of Clock Erro s the places of St rs as gi en in Vol VI had in ariably been employed down to tl e end of the year 1842 but—commenc ig with the yea 1843 I have employed the pparent places as taken from the Nautical Alman cs except in a few instances in \ hich the Nautical Almanac me n places have differed to the amount of one tenth of a second of time f om the Mad as Catalogue in whi h case the Stars so differing have been conside ed ineligible for the determi iation of Clock Erro s The Transit Clock during the period emb aced by these observations has t will be seen generally spe ki g gone well but in the few cases in \ hich irregularities have occurred the pract ce observed—of not trusting it for a pe iod of more than two or three hours has gone far to render its irregularities unimportant The two t ansit observers each diffe f om one another and my elf in the estimat on of the time at whi h a Star transits the largest amount for Equator al Stars not exceed ng foui tenths of a second of time I ha e reason however to believe that these amounts— personal equations —are not invar able and that the allowance which would be proper in the case of equato ial Stars would not apply to Stars situated near to the Pole I am not at present prepared with a good series of observations to substantiate this opinion but nevertheless feel considerable confidence in stating such to be the f ct

METEOROLOGICAL INSTRUMENTS EMPLOYED

AT page 34 Vol IV of the Madras Results I have given an account of the measures adopted for obtaining a knowledge of the erro of the Barometer employed where it appears that the correction subsequent to the 10th May 1837 was that due to capillary act on only 1 + 051 Inch This Barometer continued to be employed until the mo ning of the 5th June 1842 when sudden fall occurred to the amount of two tenths of an inch which was not confirmed by another Barometer with which I o cas onally had been accustomed to compare it continui g to watch the two Barometers the difference had gr dually crea ed during the d y nd on examinat on it turned out that the glas cister had c acked by reason of th hot la d w d thereby llowi g ome of the Merc y to escape O the 7th June 1842 I availed myself of the loan of an ex c llent Ba ometer by *Cary* hich o be g compared with the Stan da d Barometer t the M gnetic Observatory appeared to equire a or ectio — 0 040 *In* thi Barometer o tinued to be employed until the 17th June 1842 when I ucceeded n procu i Standard Barom ter by Newman—di mete of tube 0 53 *In* with gla s cistern & &c Th Barometer wl cl s m il ed Newman No 49 then stood 010 lower than the Standard No 42 employed by Capt in Ludlow at the Magnetic Ob e ato y and from compa ison made on the 3d Decembe 1847 it appeared that the Observatory Barometer (No 49) stood 013 lowe than No 42 now the latter Instrument had been compared with the Royal Society Standard p e ously to l avi g En la d i 1840 when it appeared to require a correction — 006 or the Barometrical read i gs as set down in the Circle Book equ re the following corrections

	Date					*Cor ect on*
F om	1st January	1838	to	5th Ju e	1842	+ 051
——	7th June	184	—	16th June	1842	— 040
——	17th June	1842	—	31 t December	1847	+ 007

The Thermo iete s e iployed are two of ord ary constructio i by Bate vl ch nevertheless differed by only a small fracti n of a deg ee f om Standard by Troughton w th which they were compared in 1836 but a recent comparison w th a Standard by Newman which was supplied to the Madras Magnetic Observatory shows that they each require a correction + 0 7

THE MADRAS MURAL CIRCLE

——— () ———

The Mural Circle was constructed by Dolland (see Vol I) it is 48 inches in diameter and is provided with a telescope of 49 inches focal length with a treble object glass of 3½ inches aperture and a power of 120 has on all occasions been employed the divisions to every 5′ are very beautifully executed on a slip of gold let into the circumference of the ring but having been inadvertently set off from a scale of equal parts of 3 in length they are systematically erroneous and require the corrections as given at page 217 Vol V these being applied the Madras Mural Circle is I believe second to no other similarly constructed Instrument the divisions are read off by four Micrometer Microscopes these have usually been examined as to runs once in each week but since the excess or defect of their measurement from division to division has very seldom exceeded two or three tenths of a second no correction for runs has been allowed The observations with this instrument have with but slight exception been made simultaneously with those made with the Transit Instrument —the Refractions as heretofore have been computed from Atkinson's tables as given in the 2d volume of the Royal Astronomical Society's Memoirs and the mean places employed in computing the Index Error are those brought up from the Madras Catalogue (Vol VI) In addition to the ordinary comparison of the observations of Stars with their known places I have continued to determine the Index Error by the Reflecting Collimator a plan which consists in observing the coincidence of the horizontal wire with its image as seen in a basin of quicksilver placed beneath the telescope as pointed to the Nadir whence we get

$$\frac{\quad - (180 \quad + \quad C \ \ I \ \ t.)}{\qquad} = I \ l \ \Gamma$$

Where represents the Instrumental reading and the error of division due to that reading The observations with the Reflecting Collimator have generally been made at 6 A M noon 6 P M and midnight On comparing the Index Error thus determined with those which have resulted from the observations of Stars the coincidences on the whole are by no means satisfactory the differences amounting in two instances to above four seconds! In a general way I have found these observations as made by my Assistants to agree within very narrow limits with those made by myself on one occasion however I differed from an Assistant (Verasawmy) by 2″ on examining his bisection I had no doubt whatever of its being intolerably erroneous whereas his impression of my own bisection was that it was equally in fault whereas another observer took up a mean between us we repeated our bisections several times on this and the succeeding day with like result but a few days afterwards our disagreement had ceased Observations of the Microscopes to determine the errors of runs have regularly been made once a week in a general way the error has been extremely regular and has seldom amounted to half a second but having omitted to employ it in the reduction of the observations I have thought it unnecessary to furnish the amount here

POSITION OF THE ECLIPTIC FROM THE MADRAS SOLAR OBSERVATIONS

Th nvestigation of the pos ti n of the Ecl pt c f om the observations of the Sun in the years 1831 1832 and 1833 as given in Vols I and II of the M dras Res lt a e by e son of the err neous d v n of the Mural Circle—necessarily to some extent in error wl h ende s t necessary that I sh uld here fu sh the amended ecomputation

The mp ove ne ts made n the Naut cal Almanac how ver si 1833 havi g endered it c nvenient to adopt a more comprehen ve meth d f comput t on than had p e ously been empl yed I had tho ght t suffic ent he e for these three years to furnish only th me ded esults and for the pe iod since elapsed to furn sh th details of the comput tions—thus

D te	Ob erv tions f th S to the Equ nox		Ob ervat ons f tl S t tl S lst	
	N Ob e tl ns	E f Eq P int	N Ob rv tl	M an Obli ity Jan ary 1 183
1831	36	+ 0 223	69	23 27 39 37
1832	98	+ 0 074	73	23 27 41 10
1833	77	+ 0 174	80	23 27 39 26

Since th s pe d the computation has been performed w th referenc to the method of *Normal Pl ces* which consists of tl e com par son of *all* the observations with the pla es from the N ut cal Alm ac the errors of A R and N P D thus deduced re p operly grouped and c nverted to erro s f E l ptic Polai D st nce * ass mi g these errors to ai se from an erroneous pos t of the eclipt c ass med in the N t c l Alma c they may be represent d by x + c s Sun s lo g + y × in S in s long + z wh ch quat s mmed ately lead to the solut on of the problem as w ll best appear from the e amples which now follow

OBSERVATIONS OF THE FIXED STARS

——— () ———

In vol VI of the Madras Astronomical Results is given the places of above eleven thousand Stars which had been observed at Madras during the period 1830 1840 together with the re observed places of several of these during the years 1841 1842 all being reduced to January 1st 1835 or about the middle period of observation Satisfied that in point of *quantity* the Madras Catalogue contained as much as for the present could be considered useful I have during the last three years principally confined myself to the observation of a small Catalogue only having in view to satisfy the more rigid conditions of *quality* than could be expected from the necessarily limited number of observations of the larger Catalogue

In the early volumes of the Madras Results I had estimated the mean error of a single observation as far as concerns the observer —under ordinary circumstances to amount to 0 07 seconds of time and the error of a single observation of Declination was estimated at about 0 7— these estimations having been confirmed by the experience of Astronomers generally it becomes a question of deep interest as to what causes may be attributed the large discrepancies which are often met with between catalogues of different but not very distant epochs emanating from the same Observatory and observed with the same Instruments —A mere glance at page XI (preface to the Nautical Almanac 1845) renders the suspicion strong —that in the reduction of the mean places from observation at one epoch to that of another something more than Annual Precession and Annual Proper Motion must be taken into account in several instances the total neglect of the proper motion will to some extent account for want of accordance of results whereas in others nothing short of a variable amount of proper motion can reconcile discordances —With this by way of motive I at once determined on the continued and careful observations of the Stars forming the Nautical Almanac Catalogue or rather such of them (97 in number) as were visible at Madras

On comparing the Madras Catalogue (Vol VI) with the recently published Greenwich Catalogue for 1840 — differences were met with much too large to be charged upon either the Instruments or Observers hence the necessity that the places of these Stars should be re examined and they have accordingly —to the extent of three or four observations of each—again been re-observed —In addition to these I have re observed all Stars in which an annual Proper Motion exceeding a quarter of a second of space has been noticed by Piazzi or has resulted from a comparison of Piazzi with the Madras Catalogue moreover the places of several Stars in the Brisbane Catalogue for 1825 reduced to 1835 (brought forward by ten years *Precession only* —which differed above five seconds from the Madras

Catalogue —these too have been re observed in order to settle the question as to—whether these ascertained differences arose from error in the B Catalogue or if they were the result of accumulated Proper Motion —these several motives have influenced me in the choice of a plan for observing during the period embraced by the present Catalogues viz 1843-1847 the observations may not improperly be separated into two classes the first being the permanent observations or those of the Nautical Almanac Stars and the others the Subsidiary observations—thus

PERMANENT OBSERVATIONS

The 97 Stars forming the Permanent Catalogue have been arranged in order of their Declination as being thereby better suited for comparison —the figures in the second column express the number of observations in the years 1843 1844 1845 1846 and 1847 respectively and opposite to these in the third column are the corresponding mean results—in which it must be noted that *the Right Ascensions reckon from the equinox a sumed n the Nautical Almanac Catalogues*

On comparing the Right Ascensions of Stars for the years 1843 1847 as brought up from the Catalogue given in vol VI with the places given in the Nautical Almanacs for those years it appears that the equinoctial point assumed in the one differs from that referred to in the other by 0 10 or the Right Ascensions from Vol VI—0 10 represents the Nautical Almanac places or to render our present Catalogue comparable with volume VI this reduction (0 10) must be employed and hence the places set down in the fourth column (viz Vol VI—0 10)

The fifth column of each page contains the places from the Greenwich Catalogue of 1439 Stars for 1840 which have been brought forward to 1845 by supplying five times the amount of the Precessions there given this is true at least as far as and including Columbæ for the Stars situated to the South of this which are not vi ible at Greenwich the N A places have been filled in

The next following columns containing the differences of each Catalogue from Greenwich and of the one from the other explain their own meaning

MEAN PLACES

OF

NINETY SEVEN PRINCIPAL FIXED STARS,

FROM

OBSERVATIONS MADE AT THE MADRAS OBSERVATORY

IN THE YEARS 1843—1847

REDUCED TO JANUARY 1 1845

AND

COMPARED WITH THE RESULTS OF FORMER YEARS &c

ECLIPSES

OF THE

SUN AND MOON,

AND OF THE

SATELLITES OF THE PLANET JUPITER,

TOGETHER WITH

OCCULTATIONS OF FIXED STARS BY THE MOON

IN THE INTERVAL 1838—1847

AS OBSERVED AT THE MADRAS OBSERVATORY

Observation of the Eclipse of the Moon on the 17th February 1840

The time of commencement was so very uncertain that I have not thought it necessary to place the observa tion on record

	Madra M an Time.				Madras M an Time		
		M				M	
The shadow Touches Tycho	6	13	6 7	The shadow Lea es Tycho	7	57	17 5
Co ers ——	6	31	53 6	End of the Eclipse	8	27	55 5
Discovers ——	7	54	48 0				

The umbra was much confused with the Penumbra at the last Observation

Observed with the 5 feet Achromatic power 60

Observation of the Eclipse of the Sun on the 3d March 1840

Observation of the Eclipse of the Moon on the 13th November 1845

By reason of ha e the time of commencement of the Eclipse of the Moon could not be observed w th ordinary accuracy I estimated the time as near as ci cumstances permitted at 16 29 38 2 —Observed with the 5 feet Achromat c with a power of 60

The spots were not suffic ently well defined to admit of observation

Observation of the Eclipse of the Moon on the 24th September 1847

	M dras M an Tim		M dras M an Tim
	M		M
Beg nning of the Eclipse	6 48 1 1	End of the E l pse	9 0 43 0

At the commencement of the Ecl pse tl e Moon was en eloped in halo a d ha e whe eby an un ert ty of 20 o 30 seconds attache to this ob ervation the Ecl pse p oceeded the h ze g adually dis ppeared but I w s unable to make any observation on the spots at the end of the E lipse the ky was tolerably clear and observation satisfactory

Observed with 5 feet Achromatic power 60

Observation of the Eclipse of the Sun on the 9th October 1847

On d rect ng the Telescope to the Sun at about ten minutes before the commencement of the Ecl pse there were several spots v ble on his d sc all bei g well defined with the except on of one s tuated nea to the edge bout to be e l psed this spot however I fancied had become much better defined at the time of commencement of eclipse and during the three or four minute which preceded it The sky was quite clear and the time of commencement of eclipse which was considered to be very certain and satisfactory was observed as follows

							Madras Mean Tim
							M
Observed by	W	w th 42 nch Achromatic	power	75	at	2 8	34 4
—— —	T	— 5 feet	—— —	60	—		35 9

W ef s t C ptai W te f th C rp f Madras Artill ry T to my lf and W A t M W lli m All f my A t t

Observation of the Eclipse of the Sun on the 9th October 1847 *(Continued)*

An attempt was made to observe the time of contact with and total obscurat on of a well defined d rk and double spot at 20 eco ds before the estimated time of contact the edge of tl e spot lo t its sha p es of definement and as t advanced to closer contact became mo e a d more i di t ct and confused—so as to p event my making even an approximate obser ation of the time at the other telescopes as above

	Madras M Tim H	M			
The first contact was noted at	2	25	15 1	by	W A
— —— ——	2	25	33 1	—	W

The total ecl pse of tl e spot or rather its shadow—for nothing beyond a faint shadow was visible towards the time of total obscuration—was obseived as follows

			M dr M an i H	M	
By T w th 5 f et Achromatic power	60	at	2	25	50 6
By W A — 42 incl —— —	45	—	2	25	58 1

The above ren a l s apply equally to all three obseivers we each fancied that the time of total obscuration was delayed by the ppea ance of a lengthened shadow long after the substance itself must have been covered

Another si nilar observation was made of a double spot as follows

	M lras M an Im H	M			
First contact was observed at	2	57	49 8	by	W A
— — — — —	2	57	59 8	—	W
— — — — —	2	58	0 8	—	T
Total Obscuration was observed at	2	58	46 7	—	T
— —— — — —	2	58	47 7	—	W
— —— — — —	2	58	49 7	—	W A

Botl Captain Worster nd Mr Allen agree in assign n the same appeaiances to tl is spot as exper enced in tl e observation of the last but my own impres ion was dist ct—that nothing particular had appeared we each had employed the same telescope save that on this last occasion I l ad used a power of 150

Durin my absence from the Obseivatory M Allen observed the first contact and total obscuration of a small spot as follows

	M dras M Tim H	M		
F rst contact at	3	11	1 7	With 5 f et Achromat c power 150
Total Obscuration —	3	11	21 7	

He noted that at the first contact no i d stinctness wl atever was visible but that at the time of total Obscuration the ndis tinctness and sl adow before obser ed was now equally obvious

Towards the end of tl e E l pse tl e Sun which had only 7 or 8 degrees altitude had become enveloped in haze hich rendered the observations which follow less satisfactory than could be desired

	M dras M an Ti H	M	
End of the Eclipse observed by T	5	9	20 2
— — — — — W			21 7
— — — — — W A			25 2

OCCULTATION OF STARS BY THE MOON

Date	Day	Observation		Madras Mean Time	M	
1840 June	2	Immersion of 40 *Geminorum* behind the Moon's dark limb observed with the 5 feet Achromatic (power 60) Clear observation good	at	7	4	26 1
		Immersion of 39 *Geminorum* behind the Moon's dark limb observed with the 5 feet Achromatic (power 60) Clear observation good	at	7	5	44 4
		Immersion of 37 *Geminorum* behind the Moon's dark limb observed with the 5 feet Achromatic (power 60) Moon was low but the sky being clear the observation was considered to be good	at	7	59	46 0
	4	Immersion of a small star behind the Moon's dark limb observed with the 5 feet Achromatic (power 60) Moon was low and the sky covered with thin haze but observation satisfactory	at	7	31	38 2
July	2	Immersion of 8 *Leonis* (Mag 5) behind the Moon's dark limb	at	7	31	45 1
		Do 7 *Leonis* (Mag 8) do do do		7	33	50 3
		Do 9 *Leonis* (Mag 8) do do do The Moon was low but very clear observation certain within a quarter of a second		7	36	20 4
December	27	Immersion of 837 *Capricorni* behind the Moon's dark limb observed with the 5 feet Achromatic (power 60) The Moon was very low but clear observation satisfactory	at	6	26	33 7
		Immersion of a small star in *Capricornus* behind the Moon's dark limb with the 5 feet Achromatic power 60 (9th Mag)	at	7	56	38 9
	28	Immersion of 919 *Aquarii* behind the Moon's dark limb observed with the 5 feet Achromat (power 60) The Moon was low but very clear observation very good (Mag 5 6)	at	8	20	3 0
1841 January	4	Immersion of P *Tauri* behind the Moon's dark limb observed with the 5 feet Achromatic (power 60) The Moon was in the zenith and clear observation satisfactory (Mag 6)	at	8	30	28 2
	6	Immersion of 49 *Geminor* behind the Moon's dark limb observed with the 5 feet Achromatic (power 60) clear observation very good (Mag 5)	at	6	15	47 4
	29	Immersion of 73 *Arietis* behind the Moon's dark limb observed with the 5 feet Achromatic (power 60) Moon was at a convenient altitude and clear observation good	at	9	11	14 0
February	26	Immersion of *Arietis* behind the Moon's dark limb observed with the 5 feet Achromatic (power 110) The Moon was sufficiently high and clear observation pretty good	at	7	4	44 9
March	2	Immersion of 37 *Geminor* behind the Moon's dark limb obsrvd with the 5 feet Achromatic (power 60) The Moon was in the zenith and very clear observation certain within 1	at	7	33	59 1
	3	Immersion of 82 *Geminor* behind the Moon's dark limb observed with the 5 feet Achromatic (power 60) The Moon was in the zenith and very clear observation good	at	7	46	20 1
	3	Immersion of 84 *Geminor* behind the Moon's dark limb observed with the 5 feet Achromatic (power 60) The Moon in the meridian very clear observation good	at	8	25	21 1
	4	Immersion of *Cancri* behind the Moon's dark limb observed with the 5 feet Achromatic (power 60) (Mag 5 6)	at	8	8	58 2
		Do do 4 5	at	8	14	59 7

June	1	Immersion of a small star behind the Moon's dark limb observed with the 5 feet Achromatic (power 60)	at	7	53	15 7
December	27	Immersion of a small star behind the Moon's dark limb observed with the 5 feet Achromatic (power 60)	at	7	49	3 7
		Immersion of a very small star behind the Moon's dark limb observed with the 5 feet Achromatic (power 60)	at	8	37	12 8
		Immersion of a bright star behind the Moon's dark limb observed with the 5 feet Achromatic (power 60)	at	9	9	1 6
1844 January	23	Immersion of small star (about 6th Magnitude) behind the Moon's dark limb observed with the 5 feet Achromatic (power 110)	at	7	14	33 8
	26	Immersion of a very bright star behind the Moon's dark limb in the constellation *Pegasus* observed with the 5 feet Achromatic (power 110)	at	7	17	22 4
November	14	Immersion of bright star (of 5th Magnitude) behind the Moon's dark limb observed with the 5 feet Achromatic (power 110)	at	6	3	14 2
		Immersion of star (of 6th Magnitude) behind the Moon's dark limb observed with the 5 feet Achromatic (power 110)	at	6	10	31 0
		Immersion of a star (of 7th Magnitude) behind the Moon's dark limb observed with the 5 feet Achromatic (power 110)	at	6	19	25 5
1845 January	10	Immersion of a star (of 5th Magnitude) behind the Moon's dark limb observed with the 5 feet Achromatic (power 60)	at	7	10	57 8
February	10	Immersion of a bright star behind the Moon's dark limb with 5 feet Achromatic (power 60)	at	7	29	29 4
June	9	Immersion of a bright star (about 2d Mag) behind the Moon's dark limb observed with the 5 feet Achromatic (power 60)	at	7	46	4 2

Occultation of Stars by the Moon (*Co tinued*)

			Madras	M M	T m
1845 Septembe	10	Immersion of a st (of 5th M g) in the constellation *Sagittarius* behind the Moo s d k l mb observed with the 5 feet Ach om tic (pow 60) t	7	32	12 0
		Imme n of a t (of 4th M g) in the con tellation of *Sag ttarius* b hind the Moon s dark l mb obse ed with the 5 feet Ach om ti (power 60) lea ob erv tion s t sfa tory t	8	6	47 4
Octobei	5	Immer ion of a br ght star beh d the Moon s d k limb observed with the 5 feet Achromat c (powei 110) t	7	28	14 0
	8	Imme io of a small star behind the Moon s dark limb obse ved with the 5 feet Achrom t c (power 110) at	7	22	5 3
		Imme on of a small star behind the Moon s dark limb obser ed with the 5 feet Ach omat c (powe 110) at	7	26	20 6
		Immers on f a br ght star behind the Moon dark limb observed with the 5 feet Ach omatic (power 110) at	7	34	25 3
		Imme o of a small sta behind the Moon s dark limb observed with the 5 feet Achromatic (powe 110) t	8	8	40 7
		Immer on of ery b ght star behind the Moon s dark l mb observed witl the 5 feet Achromatic (power 110) t	9	36	56 3
	9	Imme ion of a brigl t st in *Capricornus* behind the Moon s dark limb observed with the 5 feet Achromatic (power 110) at	7	31	59 0
		Immers on of a small star behi d the Moon s dark limb observed with the 5 feet Achromatic (power 110) at	8	40	47 8
		Immers on of a bright t r (of the 5th Mag) beh nd the Moon s dark limb observed with the 5 feet Achromatic (powe 110) at	10	25	51 6
No ember	3	Imm on of a tar behind the Moon s dark limb observed with the 5 feet Achromatic (powe 110) at	7	23	21 2
	4	Imme on of a tar (of 6th M g) behind the Moon s da k l mb observed with the 5 feet Achromatic (powe 110) t	7	14	44 6
		Immersion of a st r (of 7th M g) behind the Moon s dark limb observed with the 5 feet Acl romatic (power 110) at	7	27	8 6
	5	Imme ion of a star (of 5th Mag) behind the Moon s dark limb observed with the 5 feet Ach omatic (power 110) at	6	32	26 3
		Immers on of a star (of 7th Mag) behi d the Moon s dark limb with the 5 feet Achromatic (power 110) at	6	36	11 1
		Imme s on of a st r (of 7th Mag) behind the Moon s dark limb with the 5 feet Ach omatic (power 110) at	6	51	5 8
	6	Imme ion of a tar (of 3d Mag) behind the Moon s da k limb obser ed with the 5 feet Achromatic (power 110) at	6	56	50 3
		Emersion of the abo e star from behind the Moon s enlgtd limb with 5 feet Achromat c (power 110) at	8	19	37 4
		Imme sion of a bright sta behind the Moon s dark limb ob erved with the 5 feet Achromatic (power 110) at	9	31	2 8
	7	Immer ion of a br ght star behind the Moon s dark limb observed with the 5 feet Achromatic (power 110) good at	9	36	4 1
1846 Janua y	31	Immersion of a bright star behind the Moon s dark limb observed with the 5 feet Achromatic (power 110) at	8	4	18 3

Occultation or Stars by the Moon (Cont d)

1846			M dras Mea im H	M	S.
M ch	1	Imme ıon of br gl t ta of (5th Mag) behınd the M o d rk lımb ob e ed wıth the 5 feet Acl r matı (po e 110) t	7	48	12 2
		Imme ıon of a b ght st of (3d Mag) b l ı d the Moo ı dark l mb ob e v d w th the 5 f t Acl o t c (powe 240) at	8	42	39 2
	2	Occult t o of ta of tl e (7th M g) by the Moon s d k lı b obse ed w th the 5 f et Achrom t (po e 110) e y s tısf cto y ob e t o t	6	52	53 1
		O cultatı n of a t of tl e (3d M g) by tl Moon s d k l mb ob er ed with the 5 feet Acl o tı (po er 110) tı f to y ob e at on t	7	43	47 1
		Occ lt tı of tar of the (3d Mag) by the Moon s d rk l mb observed w th the 5 feet Achromat c (power 110) ood obs vatıo at	8	58	54 3
	3	Occ ltatıo ı of a ta of the (7th M g) by the Moo d k l mb obser ed witl the 5 feet Achrom tı (po e 110) tı f cto y b e atıo t	7	8	20 2
		Occultat ı of a br ght star by the Moon s d rk lımb obser ed wıth the 5 feet Achromat c (power 110) e y good t	9	42	52 9
	5	Occultat on of star of tl e (5th Mag) by the Moon s dark lımb observed wıth the 5 feet Achromatıc (powe 110) ery good obser atıon at	7	59	59 4
		Occultatıon of a b ght tar by the Moon s dark lımb observed wıth the 5 feet Achromat c (power 110) ery good at	11	8	34 4
	8	Occultatıon of a st of the (3d Mag) by tl e Moon s da k lımb observed wıth the 5 feet Acl omatıc (power 60) very sat sfa to y obser atıon at	7	44	15 5
	31	Occultatıon of a star of the (2 l Mag) by the Moo s lark l mb obser ed wıth the 5 feet Ach omatıc (powe 110) c y good obse vat on at	6	50	44 3
Aprıl	28	Occultat on of a b ght sta by the Moon s dark l mb observed wıth the 5 feet Achromat c (power 110) good obse v tıo at	7	52	37 1
May	2	Occultatıon of a b ıght sta bel ınd tl e Moon d rk lımb observed wıth the 5 feet Achromatıc (powe 110) ve y satısfacto y ob er atıon at	7	16	52 1
September	24	Occultat on of a br ght star bel ınd the Moon s dark lımb observed wıth the 5 feet Achromat c (power 110) ve y good obser at on t	7	46	53 1
	26	Occultatıon of a st bel ınd the Moon s dark lı nb obser ed wıth the 5 feet Achromatıc (power 110) good obser atıo at	6	55	27 8
		Occultat on of a star behınd the Moon s dark lımb observed w th the 5 feet Achromat c (power 110) very good observatıo t	7	22	24 9
		Occultatıon of tar behınd tl e Moon s dark lımb ob erved wıth the 5 feet Achromatıc (power 110) t	8	30	8 3
	28	Occultatıon of *ϱ' S gıttarı* behınd the Moon s dark lımb observed wıth the 5 feet Achromatıc (power 110) good at	8	15	4 6
		Occult tıon of st r by tl e Moon s da k l mb observed wıth the 5 feet Achromatıc (power 110) obse atıon satısfactory at	9	28	56 6
	28	Oc ıltatıon of a br gl t sta by the Moon s da k l mb obse ved v th the 5 feet Achromatıc (powe 110) satısfactory t	9	30	50 2
		Occult t on of a sm ll tar by the Moon s dark lımb observed wıth the 5 feet Acl romatıc (power 110) satısf ctory at	10	11	57 6
		Occultatıon of small star by the Moon s da k l mb observed wıth the 5 feet Achromatıc (powe 110) good t	10	18	4 6

Occultation of Stars by the Moon *(Conti u d)*

			M	rns Mon M	im
1846 Septembe	28	Occult t on of a small t by the Moon s dark limb obser ed with the 5 feet Ach omat (powe 110) not e y sat f to y t	11	12	8 7
	29	Occultation f a st r by the Moon s da k limb ob erved witl the 5 feet A h om tic (power 110) tisfactory ob e tion t	9	23	6 3
1847 January	19	Occultation of a st r behind the Moon s dark l mb obser ed with the 5 feet A h omati (powe 110) t	6	57	4 5
	20	Occult tion of a star beh nd the Moon s d rk limb obser ed with the 5 feet Achromatic (power 110) t	8	9	41 6
		Occult tion of a st r behi d the Moon s dark limb observed w th the 5 feet Achromatic (powe 110) t	8	20	35 8
	21	Occult t on of a small st r behind the Moon s dark limb obser ed with the 5 feet Ach om tic (power 110) t	7	6	31 1
		Occult t on of *Piscium* of (4th M g) by the Mo n s d k limb obser ed with the 5 feet Ach omat (powe 110) e y tisf to y obse atio at	7	49	24 5
		Occultation of a m ll ta b hi d the Moon dark limb obse ed with the 5 feet Ach omat c (power 110) atisfacto y obser ation at	8	42	22 3
	23	Occult t on of a small star by the Moon dark limb obser ed w th the 5 f et Achromatic (powe 110) t	9	45	29 7
February	23	Occult t on of a b ght star beh nd the Moon s dark limb observed with the 5 feet Achromat c (power 110) ob e vation very good t	9	10	41 0
Apr l	19	Occ ltat on of a mall ta by the Moon s dark limb observed with the 5 feet Ach omatic (powe 110) good ob e ation t	7	7	33 1
		Oc ltat on of b ght st by the Moon d k l mb obser ed with the 5 feet Achrom t (powe 110) e y good observation t	7	10	55 6
		O ci lt t on of a sm ll ta by the Moon s da l l mb observed w th the 5 feet Achromatic (power 110) good obse tion at	7	42	39 4
		Occi lt tion of y b ght ta by the Moon dark l mb obse ed with tl e 5 feet Achromat c (powe 110) e y good ob v t o at	8	7	3 8
		Occi lt t on of a ve y b ght star by the Moon s dark l mb obser ed with the 5 feet Achromat (power 110) e y good obser ation t	8	19	5 9
May	19	Occultat on of a br ght t of (4th Mag) by the Moon s dark limb obser ed with the 5 feet Ach omatic (powe 110) ve y satisf cto y obse atio t	7	48	40 4
September	20	Occultat on of a sta of 4th Mag by the Moon s d k limb observed with the 5 feet Ach omatic (power 110) t	7	29	33 5
		Occultat on of a ve y b ght t of 2d M g by the Moon s dark limb observed with the 5 feet A hromatic (power 110) very ood ob ervatio t	7	37	35 7
October	15	Occult tion of a star by the Moon dark l mb observed with the 5 feet Achromatic (power 110) good at	7	15	2 2
		Occultation of a star by the Moon s dark limb observed w th the 5 feet Achromatic (power 110) very good t	7	49	34 5
November	11	Occult tion of a star by the Moon s dark limb observed with the 5 feet Achromatic (power 110) haze observation not satisfactory at	6	47	21 2
